Graphing Activity

Introduction

Graphing is used by scientists to display the data that is collected during a controlled experiment. A line graph must be constructed to accurately depict the data collected. An incorrect graph will often lead to the acceptance of an incorrect hypothesis or detract from the acceptance of a correct hypothesis.

The graph should contain 5 major parts. The title, the independent variable, the dependent variable, the scales for each variable, and a legend.

- 1.) The title: this shows what the graph is about. Reading the title should give the reader an an idea about the graph. It should be a concise statement placed above the graph.
- 2.) The Independent Variable: this is the variable (part of the experiment that changes) that can be controlled or manipulated by the experimenter. This variable should be placed on the horizontal or x-axis.
- 3.) The Dependent Variable: this is the variable directly affected by the independent variable. It is the result of what happens because of the independent variable. This variable is placed on the y or vertical axis.
- 4.) The Scales for each Variable: In constructing a graph, one needs to know where to plot the points representing the data. In order to do this a scale must be employed that will include all the data points. Each block should have a consistent amount or increment on a particular axis. While the scale should allow as much of the graph to be taken up as possible, it is not a good idea to set up a scale that is hard to manage. For example, multiples of 5, 10, etc. are good, while multiples such as 1.22 are not! Your scale must be plotted on the amount of graph space available, and will be dictated by the data points.
- 5.) The Legend: this is a short descriptive narrative concerning the graph's data. It should be short and to the point and placed directly under the graph.

Diabetes is a disease affecting the insulin producing glands of the pancreas. If there is not enough insulin being produced by the cells, the amount of glucose in the blood will remain high. A blood glucose level above 140 for an extended period of time is not considered normal. This disease, if not brought under control, will lead to severe complications and even death.

 Use the data in the table below to complete the graph provided. Remember to title your graph, label the axes properly when setting up your scale, make a key, and to write a legend for your graph when completed.

Time After Feding (Luc)	Glucose Level in ml/liter of Glucose Level in ml/liter of	ml/liter of Glucose Level in ml/liter of
THIE AIRT DAVING (III S.)	blood in person A	blood in person B
	170	180
	155	195
1.5	140	230
2	135	245
2.5	140	235
3	135	225
4	130	200

Answer the following questions based on the graph you just completed.

- 7. If the time period were extended to 6 hours, what would be the expected blood sugar level for Person B?
- 8. What would be a probable blood sugar level for person B at 3.5 hours?
- 9. Use one or more complete sentences to state a conclusion about graph # 2.
